On warped product generalized Roter type manifolds

A. A. Shaikh, H. Kundu

Dedicated to Professor Lajos Tamássy on his ninety-first birthday

Abstract. Generalized Roter type manifolds form an extended class of Roter type manifolds, which gives rise the form of the curvature tensor in terms of algebraic combinations of the fundamental metric tensor and Ricci tensors up to level 2. The object of the present paper is to investigate the characterization of a warped product manifold to be a generalized Roter-type (and hence as a special case for Roter type and conformally flat) manifold. We also present an example by a metric which ensures the existence of a warped product generalized Roter type manifold but is not Roter type manifold.

Key words: Roter type manifold; generalized Roter type manifold; conformally flat manifold; Ricci tensors of higher levels; warped product manifold

1 Introduction

Let $M$ be an $n$ $(\geq 3)$-dimensional connected semi-Riemannian smooth manifold equipped with a semi-Riemannian metric $g$. We denote the Levi-Civita connection, the Riemann-Christoffel curvature tensor, Ricci tensor, scalar curvature and the space of all smooth functions on $M$ by $\nabla$, $R$, $S$, $\kappa$ and $C^\infty(M)$ respectively. The manifold $M$ is flat if $R = 0$ and $M$ is of constant curvature if $R$ is a constant multiple of the Gaussian curvature tensor. For a conformally flat manifold $M$, $R$ can be expressed as

$$R = J_1 g \wedge g + J_2 g \wedge S,$$

where $J_1, J_2 \in C^\infty(M)$. Especially, $M$ is flat (resp., constant curvature and conformally flat) if $J_1 = J_2 = 0$ (resp., $J_1 = \frac{\kappa}{n(n-1)}$, $J_2 = 0$ and $J_1 = -\frac{\kappa}{2(n-1)(n-2)}$, $J_2 = \frac{1}{n-2}$). The manifold $M$ is Roter type (briefly, $RT_n$; see [4, 17]) if $R$ can be expressed as a linear combination of $g \wedge g$, $g \wedge S$ and $S \wedge S$. Very recently, Shaikh et al. [25] introduced the notion of generalized Roter type manifold. A manifold is said to be generalized Roter type (briefly, $GRT_n$) if its curvature tensor can be expressed as a linear combination of $g \wedge g$, $g \wedge S$, $S \wedge S$, $g \wedge S^2$, $S \wedge S^2$ and $S^2 \wedge S^2$. We note
that the name “generalized Roter type” was first used in [25]. For general properties of $GRT_n$ and its proper existence we refer the readers to see [28] and also references therein.

The paper is organized as follows. Section 2 is concerned with preliminaries. Section 3 deals with warped product manifolds and various curvature relations. Section 4 is devoted to the study of warped products $GRT_n$ and obtained the characterization of such manifolds (see Theorem 4.1). We obtain the characterization of a warped product manifold to be $RT_n$ and conformally flat. The last section deals with the proper existence of such notion by an example with a suitable metric.

2 Preliminaries

Let $M$ be an $n$ ($\geq 3$)-dimensional semi-Riemannian manifold and $S^2$ be its level 2 Ricci tensor of type $(0,2)$. In terms of local coordinates, the tensor $S^2$ can be expressed as

$$S^2_{ij} = g^{kl} S^2_{ik} S_{jl}.$$ 

Similarly the Ricci tensors of level 3 and 4, $S^3$ and $S^4$ are respectively defined as

$$S^3_{ij} = g^{kl} S^2_{ik} S_j^l$$ and $$S^4_{ij} = g^{kl} S^3_{ik} S_{jl}.$$ 

Now for two $(0,2)$ tensors $A$ and $E$, their Kulkarni-Nomizu product ([5], [7], [11], [18]) $A \wedge E$ is given by

$$(A \wedge E)_{ijkl} = A_{il} E_{jk} + A_{jk} E_{il} - A_{ik} E_{jl} - A_{jl} E_{ik}.$$ 

In particular, we can define $g \wedge g$, $g \wedge S$, $S \wedge S$, $g \wedge S^2$, $S \wedge S^2$ and $S^2 \wedge S^2$ as follows:

$$(g \wedge g)_{ijkl} = 2(g_{il} g_{jk} - g_{ik} g_{jl}), \quad (g \wedge S)_{ijkl} = g_{il} S_{jk} + S_{ik} g_{jl} - g_{ik} S_{jl} - S_{ik} g_{jl},$$

$$(S \wedge S)_{ijkl} = 2(S_{il} S_{jk} - S_{ik} S_{jl}), \quad (g \wedge S^2)_{ijkl} = g_{il} S^2_{jk} + S^2_{ik} g_{jl} - g_{ik} S^2_{jl} - S^2_{ik} g_{jl},$$

$$(S \wedge S^2)_{ijkl} = S_{il} S^2_{jk} + S^2_{ik} S_{jl} - S_{ik} S^2_{jl} - S^2_{ik} S^2_{jl}, \quad (S^2 \wedge S^2)_{ijkl} = 2(S^2_{il} S^2_{jk} - S^2_{ik} S^2_{jl}).$$

We note that the tensor $\frac{1}{2}(g \wedge g)$ is known as Gaussian curvature tensor and is denoted by $G$. A tensor $D$ of type $(0,4)$ on $M$ is said to be generalized curvature tensor ([5], [7], [11]), if

$$(i) D_{ijkl} + D_{jikl} = 0, \quad (ii) D_{ijkl} = D_{klji}, \quad (iii) D_{ijkl} + D_{jikl} + D_{kijl} = 0.$$ 

Moreover if $D$ satisfies the second Bianchi identity, i.e.,

$$D_{ijkl,m} + D_{jmkl,i} + D_{mikl,j} = 0,$$

then $D$ is called a proper generalized curvature tensor, where ‘coma’ denotes the covariant derivative. If $A$ and $B$ are two symmetric $(0,2)$ tensors, then $A \wedge B$ is obviously a generalized curvature tensor.

We mention that there are various generalized curvature tensors which are linear combination of Riemann-Christoffel curvature tensor with Kulkarni-Nomizu products.
of some tensors. One such important curvature tensor is the conformal curvature tensor \(C\), and is given by
\[
C = R - \frac{1}{n-2}g \wedge S + \frac{\kappa}{2(n-1)(n-2)}g \wedge g.
\]
We refer the readers to see [27] for details about the various curvature tensors and geometric structures along with their equivalency.

**Definition 2.1.** Let \(M\) be a semi-Riemannian manifold satisfying the following condition
\[
R = N_1 g \wedge g + N_2 g \wedge S + N_3 S \wedge S,
\]
for some \(N_1, N_2\) and \(N_3 \in C^\infty(M)\). The above condition is called a Roter type condition and \(M\) is called a Roter type manifold ([?, 6, 13, 19, 21]) with \(N_1, N_2\) and \(N_3\) as the associated scalars.

It may be mentioned that every conformally flat manifold of dimension \(\geq 4\), as well as every 3-dimensional manifold are Roter type.

**Definition 2.2.** Let \(M\) be a semi-Riemannian manifold satisfying the following condition
\[
R = L_1 g \wedge g + L_2 g \wedge S + L_3 S \wedge S + L_4 g \wedge S^2 + L_5 S \wedge S^2 + L_6 S^2 \wedge S^2,
\]
for some \(L_i \in C^\infty(M), 1 \leq i \leq 6\). The above condition is called a generalized Roter type condition and \(M\) is called a generalized Roter type manifold ([25], [28]) with \(L_i\)'s as the associated scalars.

For details about the geometric properties of generalized Roter type manifold we refer the readers to see [28]. We mention that such decompositions of \(R\) were already investigated in [8], [12], [23] and very recently in [9], [10], [24]. Throughout this paper by a proper \(GRT_n\) we mean a \(GRT_n\) which is not a \(RT_n\), and by a proper \(RT_n\) we mean a \(RT_n\) which is not conformally flat. A \(GRT_n\) or a \(RT_n\) is said to be special if one or more of their associated scalars are identically zero or assume some particular values.

Again contracting the Roter type and generalized Roter type conditions Shaikh and Kundu [28] presented some generalizations of Einstein metric conditions.

**Definition 2.3.** [1] If in a semi-Riemannian manifold \(M, S\) and \(g\) (resp., \(S^2, S\) and \(g; S^3, S^2, S\) and \(g; S^4, S^3, S^2, S\) and \(g\)) are linearly dependent then it is called \(Ein(1)\) (resp., \(Ein(2); Ein(3); Ein(4))\) manifold. The \(Ein(1)\) manifold is known as Einstein manifold and in this case we have \(S = \frac{\kappa}{n}g\).

We note that every \(Ein(i)\) manifold is \(Ein(i + 1)\) for \(i = 1, 2, 3\) but not conversely [25]. It is well known that every manifold of constant curvature is always Einstein. Again a \(RT_n\) is \(Ein(2)\) except \(N_1 = -\frac{\kappa}{2(n-1)(n-2)}, N_2 = \frac{1}{n-2}, N_3 = 0\); and a \(GRT_n\) is \(Ein(4)\) except \(L_1 = \frac{1}{2}\left(\frac{L_4(\kappa^2 - \kappa^{(2)})}{n-1} - \frac{\kappa}{(n-1)(n-2)}\right), L_2 = \frac{1}{n-2} - L_4 \kappa, L_3 = \frac{1}{2} L_4 (n-2), L_5 = 0, L_6 = 0\), where \(\kappa^{(2)} = tr(S^2)\).
3 Warped product manifolds

Let \((M, \tilde{g})\) and \((\tilde{M}, \bar{g})\) be two semi-Riemannian manifolds of dimension \(p\) and \((n-p)\) respectively \((1 \leq p \leq n-1)\). The product metric \(\tilde{g}\) on \(M = \tilde{M} \times \tilde{M}\) is defined as

\[
\tilde{g} = \pi^*(\bar{g}) + \sigma^*(\tilde{g}),
\]

where \(\pi : M \to \tilde{M}\) and \(\sigma : M \to \tilde{M}\) are the natural projections. Generalizing this notion of product metric, Kruˇckoviˇc [22] introduced the notion of semi-decomposable metric \(g\) on \(M\) as

\[
g = \pi^*(\bar{g}) + (f \circ \pi)\sigma^*(\tilde{g}),
\]

where \(f\) is a positive smooth function on \(\tilde{M}\). Again to construct a large class of complete manifolds of negative curvature, Bishop and O’Neill [2] obtained the same notion and named as warped product manifold. We mention that in the literature of differential geometry the name warped product is more widely used and here we also use the name ‘warped product manifold’.

Let \(M\) be the warped product manifold equipped with the warped product metric \(g\). If we consider a product chart

\[
(U \times V; x^1, x^2, \ldots, x^p, x^{p+1} = y^1, x^{p+2} = y^2, \ldots, x^n = y^{n-p})
\]
on \(M\), then in terms of local coordinates, \(g\) can be expressed as

\[
(3.1) \quad g_{ij} = \begin{cases} 
\bar{g}_{ij} & \text{for } i = a \text{ and } j = b, \\
\tilde{g}_{ij} & \text{for } i = \alpha \text{ and } j = \beta, \\
0 & \text{otherwise},
\end{cases}
\]

where \(a, b \in \{1, 2, \ldots, p\}\) and \(\alpha, \beta \in \{p+1, p+2, \ldots, n\}\). We note that throughout the paper we consider \(a, b, c, \ldots \in \{1, 2, \ldots, p\}\) and \(\alpha, \beta, \gamma, \ldots \in \{p+1, p+2, \ldots, n\}\) and \(i, j, k, \ldots \in \{1, 2, \ldots, n\}\). Here \(\bar{M}\) is called the base, \(\tilde{M}\) is called the fiber and \(f\) is called the warping function of \(M\). If \(f = 1\), then the warped product reduces to the product manifold. Moreover, when \(\Omega\) is a quantity formed with respect to \(g\), we denote by \(\bar{\Omega}\) and \(\bar{\Omega}\), the similar quantities formed with respect to \(\bar{g}\) and \(\tilde{g}\) respectively.

The non-zero local components \(R_{hijk}\) of the Riemann-Christoffel curvature tensor \(R\), \(\hat{S}_{jk}\) of the Ricci tensor \(S\) and the scalar curvature \(\kappa\) of \(M\) are given by

\[
(3.2) \quad R_{abcd} = \bar{R}_{abcd}, \quad R_{a\alpha b\beta} = fT_{ab}\bar{g}_{\alpha\beta}, \quad R_{a\beta\gamma\delta} = f\bar{\tilde{R}}_{a\beta\gamma\delta} - f^2P\tilde{G}_{a\beta\gamma\delta},
\]

\[
(3.3) \quad S_{ab} = \bar{S}_{ab} - (n-p)T_{ab}, \quad S_{\alpha\beta} = \bar{S}_{\alpha\beta} + Q\bar{g}_{\alpha\beta}, \quad \text{and}
\]

\[
(3.4) \quad \kappa = \bar{\kappa} + \frac{\bar{\kappa}}{f} - (n-p)[(n-p-1)P - 2\, tr(T)],
\]

where \(G_{ijkl} = g_{il}g_{jk} - g_{ik}g_{jl}\) are the components of Gaussian curvature and

\[
T_{ab} = -\frac{1}{2f}(f_{a,b} - \frac{1}{2f}f_{a}f_{b}), \quad tr(T) = g^{ab}T_{ab},
\]

\[
P = \frac{1}{4f^2}g^{ab}f_{a}f_{b}, \quad Q = -f((n-p-1)P + tr(T)), \quad f_{a} = \partial_{a}f = \frac{\partial f}{\partial x^a}.
\]
For more detail about warped product components of basic tensors we refer the readers to see [20], [26] and also references therein.

Now from above results we can easily calculate the local components of various necessary tensors. The non-zero local components of $S^2$, $(g \wedge g)$, $(g \wedge S)$, $(S \wedge S)$, $(g \wedge S^2)$, $(S \wedge S^2)$ and $(S^2 \wedge S^2)$ are given as follows:

\begin{equation}
(i) S^2_{ab} = S^2_{ab} + (n-p)(S \cdot T)_{ab} + (n-p)^2 T^2_{ab},
(ii) S^2_{\alpha\beta} = \frac{1}{f}[S^2_{\alpha\beta} + 2QS_{\alpha\beta} + Q^2\bar{g}_{\alpha\beta}],
\end{equation}

\begin{equation}
(i)(g \wedge g)_{abcd} = (g \wedge g)_{abcd},
(ii)(g \wedge g)_{aabcd} = -2f\bar{g}_{ab}\bar{g}_{a\beta},
(iii)(g \wedge g)_{a\alpha\beta\delta} = f^2(g \wedge g)_{a\beta\gamma\delta}.
\end{equation}

\begin{equation}
(i)(g \wedge S)_{abcd} = (g \wedge S)_{abcd} - (n-p)(g \wedge T)_{abcd} + (n-p)^2(T \wedge T)_{abcd},
(ii)(g \wedge S)_{aabcd} = -2f\bar{g}_{ab}(S_{a\beta} + Q\bar{g}_{a\beta}) - f\bar{g}_{a\beta}(\bar{S}_{ab} - (n-p)T_{ab}),
(iii)(g \wedge S)_{a\alpha\beta\delta} = f(g \wedge S)_{a\beta\gamma\delta} + 2fQS_{a\beta\gamma\delta} + Q^2(g \wedge g)_{a\beta\gamma\delta}.
\end{equation}

\begin{equation}
(i)(g \wedge S^2)_{abcd} = (g \wedge S^2)_{abcd} + (n-p)(g \wedge (S \cdot T))_{abcd} + (n-p)^2(T \wedge T)_{abcd},
(ii)(g \wedge S^2)_{aabcd} = -\frac{1}{f}\bar{g}_{ab}(S^2_{a\alpha} + 2QS_{a\alpha} + Q^2\bar{g}_{a\beta}) - f\bar{g}_{a\beta}(S^2_{ab} + (n-p)S \cdot T_{ab} + (n-p)^2 T^2_{ab}),
(iii)(g \wedge S^2)_{a\alpha\beta\delta} = (g \wedge S^2)_{a\beta\gamma\delta} + 2Q(g \wedge S)_a\beta\gamma\delta + Q^2(g \wedge g)_{a\beta\gamma\delta}.
\end{equation}

\begin{equation}
(i)(S \wedge S^2)_{abcd} = (S \wedge S^2)_{abcd} + (n-p)(S \wedge (S \cdot T))_{abcd} + (n-p)^2(S \wedge T)_{abcd} - (n-p)^3(T \wedge T)_{abcd} + (n-p)^4(T \wedge T)_{abcd},
(ii)(S \wedge S^2)_{aabcd} = -\frac{1}{f}(S_{a\alpha} - (n-p)T_{ab})(S^2_{a\alpha} + 2QS_{a\alpha} + Q^2\bar{g}_{a\beta}) - (S_{a\alpha} + 2Q\bar{g}_{a\beta})
\end{equation}

\begin{equation}
(iii)(S \wedge S^2)_{a\alpha\beta\delta} = \frac{1}{f}(S \wedge S^2)_{a\alpha\beta\delta} + 4Q(S \wedge S)_{a\alpha\beta\delta} + Q^2(S \wedge g)_{a\alpha\beta\delta} + Q^2(S \wedge S^2)_{a\alpha\beta\delta} + 2Q^2(S \wedge g)_{a\alpha\beta\delta} + 2Q^3(g \wedge g)_{a\alpha\beta\delta}.
\end{equation}
\[
(i)(S^2 \wedge S^2)_{abcd} = (S^2 \wedge S^2)_{abcd} + (n - p)^3((S \cdot T) \wedge (S \cdot T))_{abcd}
+ (n - p)^2(T^2 \wedge T^2)_{abcd} + 2(n - p)^3(S^2 \wedge T^2)_{abcd}
+ 2(n - p)^3(S^2 \wedge (S \cdot T))_{abcd},
\]
\[
(ii)(S^2 \wedge S^2)_{\alpha \beta \gamma \delta} = -\frac{1}{2}(S^2_{\alpha \beta} + (n - p)(S \cdot T)_{\alpha \beta} + (n - p)T^2_{\alpha \beta}),
\]
\[
(iii)(S^2 \wedge S^2)_{\alpha \beta \gamma \delta} = \frac{1}{2}[(S^2 \wedge S^2)_{\alpha \beta \gamma \delta} + 4Q^2(S \wedge S)_{\alpha \beta \gamma \delta}
+ Q^4(g \wedge g)_{\alpha \beta \gamma \delta} + 4Q(S^2 \wedge S)_{\alpha \beta \gamma \delta}
+ 2Q^2(g \wedge S^2)_{\alpha \beta \gamma \delta} + 4Q^3(g \wedge S)_{\alpha \beta \gamma \delta}].
\]

From above it follows that the components of \(g \wedge g, g \wedge S, S \wedge S, g \wedge S^2, S \wedge S^2 \) and \(S^2 \wedge S^2 \) are given in a quadratic form of Kulkarni-Nomizu product for base and fiber part, and quadratic form of the product for the mixed part. So each of them can be expressed by a matrix. For example, \((g \wedge S)_{abcd}, (g \wedge S)_{\alpha \beta \gamma \delta} \) and \((g \wedge S)_{\alpha \beta \gamma \delta} \) can respectively be expressed as

<table>
<thead>
<tr>
<th>∧</th>
<th>(\mathfrak{g})</th>
<th>(S)</th>
<th>(\mathfrak{g} \wedge S)</th>
<th>(\mathfrak{T})</th>
<th>(\mathfrak{T}^2)</th>
<th>(\mathfrak{S} \wedge \mathfrak{T})</th>
</tr>
</thead>
<tbody>
<tr>
<td>(\mathfrak{g})</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>(\mathfrak{S})</td>
<td>(\frac{1}{2})</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>(S)</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>(S^2)</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>

<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Similarly, we can get the matrix representations of the components for the other tensors \(g \wedge g, S \wedge S, g \wedge S^2, S \wedge S^2 \) and \(S^2 \wedge S^2 \).

4 Warped product generalized Roter-type manifolds

**Theorem 4.1.** If \(M^n = \mathcal{M}^p \times_f \mathcal{M}^{n-p}\) is a warped product manifold, then \(M\) satisfies the generalized Roter type condition

\[(4.1) \quad R = L_1 g + L_2 g + L_3 S + L_4 S + L_5 S \wedge S + L_6 S \wedge S^2 + L_7 S^2 \wedge S^2 \]

if and only if

(i) the Riemann-Christoffel curvature tensor \(\overline{R}\) of \(M\) can be expressed as

<table>
<thead>
<tr>
<th>∧</th>
<th>(\mathfrak{g})</th>
<th>(S)</th>
<th>(\mathfrak{T})</th>

</tr>
</tbody>
</table>

Proof. In terms of local coordinates, (4.1) can be expressed as

\[(4.2) \quad R_{ijkl} = L_1 (g \wedge g)_{ijkl} + L_2 (g \wedge S)_{ijkl} + L_3 (S \wedge S)_{ijkl} + L_4 (g \wedge S^2)_{ijkl} + L_5 (S \wedge S^2)_{ijkl} + L_6 (S^2 \wedge S^2)_{ijkl}.
\]

From (4.2) it follows that we can consider the following three cases:

(I) $i = a, j = b, k = c, l = d$;

(II) $i = a, j = \beta, k = \gamma, l = \delta$;

(III) $i = a, j = \alpha, k = b, l = \beta$.

Consider the case I: $i = a, j = b, k = c, l = d$ in (4.2) and using (3.2)-(3.11), we get

\[
\overline{R}_{abcd} = L_1 (g \wedge g)_{abcd} + L_2 (S - (n - p) T) \wedge (S - (n - p) T)_{abcd} + L_3 (g \wedge (S - (n - p) T) \wedge (S - (n - p) T)_{abcd} + L_4 (g \wedge (S - (n - p) T) \wedge (S - (n - p) T)_{abcd} + L_5 (S \wedge S)_{abcd} + L_6 (S \wedge S)_{abcd} + L_6 (S \wedge S)_{abcd}.
\]

Now expressing the above in matrix form, we get (i). Similarly setting $i = \alpha, j = \beta, k = \gamma, l = \delta$ in (4.2) and using (3.2)-(3.11), we obtain

\[
f T_{ab} g_{\alpha \beta} = -2 L_1 f g_{ab} \tilde{g}_{\alpha \beta} - L_2 \left[ g_{ab} (S_{\alpha \beta} + Q \tilde{g}_{\alpha \beta}) + f \tilde{g}_{\alpha \beta} (S_{ab} - (n - p) T_{ab}) \right] - (S_{ab} - (n - p) T_{ab}) \left[ 2 L_3 (S_{\alpha \beta} + Q \tilde{g}_{\alpha \beta}) + \frac{L_5}{f} (S_{\alpha \beta}^2 + 2 Q S_{\alpha \beta} + Q^2 \tilde{g}_{\alpha \beta}) \right] - \frac{L_4}{f} \tilde{g}_{ab} (S_{\alpha \beta}^2 + 2 Q S_{\alpha \beta} + Q^2 \tilde{g}_{\alpha \beta})
\]

Now simplifying above and expressing in matrix form, we obtain (iii). This completes the proof. □

The above theorem yields the following:
Corollary 4.2. If \( M^n = \overline{M}^p \times f \overline{M}^{n-p} \) is a warped product manifold with \( (n-p) \geq 3 \) satisfying the generalized Roter-type condition (4.1), then

(i) the fiber \( \overline{M} \) is generalized Roter type.
(ii) the fiber \( \overline{M} \) is Roter type if \( J_1 \neq 0 \), where

\[
J_1 = -\frac{1}{f} \left[ L_4 p + L_5 (\text{tr}(T)(n-p) + \pi) + 2L_6 \left( \text{tr}(T^2)(n-p)^2 + (n-p)\text{tr} (\overline{S} \cdot T) + \kappa^{(3)} \right) \right].
\]

(iii) the fiber \( \overline{M} \) is of vanishing conformal curvature tensor if \( J_1 \neq 0 \) and

\[
\left( J_2^2 L_6 \right) \frac{f^2}{(J_1)^2} + \frac{J_2 (fL_5 + 4L_6 Q)}{f^2 J_1} + \frac{2Q (fL_5 + 2L_6 Q)}{f^2} + L_3 = 0,
\]

where \( J_2 = -\frac{1}{f} \left[ (fL_5 + 4L_6 Q) \left( (n-p) (\text{tr}(T^2)(n-p) + \text{tr}(\overline{S} \cdot T)) + \kappa^{(3)} \right) \right.

\]

\[
+ p(fL_2 + 2L_4 Q) + 2\text{tr}(T)(n-p)(fL_3 + L_5 Q) + 2\pi (fL_3 + L_5 Q) \Big].
\]

(iv) the fiber \( \overline{M} \) is of constant curvature if \( J_1 = 0 \) and \( J_2 \neq 0 \).

Corollary 4.3. If \( M^n = \overline{M}^p \times f \overline{M}^{n-p} \) is a warped product manifold with \( p \geq 3 \) satisfying generalized Roter-type condition (4.1), then the base \( \overline{M} \) is generalized Roter type if \( T \) can be expressed as a linear combination of \( \overline{g} \) and \( \overline{S} \).

From Theorem 4.1 we can easily get the necessary and sufficient condition for a warped product manifold to be Roter type.

Corollary 4.4. If \( M^n = \overline{M}^p \times f \overline{M}^{n-p} \) is a non-flat warped product manifold, then \( M \) satisfies the Roter type condition

\[(4.3) \quad R = N_1 g \wedge g + N_2 g \wedge S + N_3 S \wedge S\]

if and only if

(i) \( \overline{R} = \begin{array}{|c|c|c|c|} \hline \wedge & \overline{g} & \overline{S} & T \\ \hline \overline{g} & N_1 & \frac{N_2}{2} & \frac{1}{2} N_2 (p-n) \\ \overline{S} & \frac{N_2}{2} & N_3 & N_3 (p-n) \\ T & \frac{1}{2} N_2 (p-n) & N_3 (p-n) & N_3 (n-p)^2 \\ \hline \end{array} \)

(ii) \( f \overline{R} = \begin{array}{|c|c|c|c|} \hline \wedge & \overline{g} & \overline{S} & T \\ \hline \overline{g} & N_1 f^2 + N_2 Q f + N_3 Q f^2 - \frac{f}{2} & \frac{L N_2}{2} + N_3 Q \\ \overline{S} & \frac{L N_2}{2} + N_3 Q & N_3 \\ \hline \end{array} \)

(iii) \( g = -2f N_1 - N_2 Q \quad S - f N_2 - 2N_3 Q \quad T - f(1 + N_2(n-p)) - 2N_3 Q(n-p) = 0. \)

Proof. The result follows from Theorem 4.1, by setting \( L_1 = N_1, L_2 = N_2, L_3 = N_3 \) and \( L_4 = L_5 = L_6 = 0. \)
Corollary 4.5. If $M^n = \tilde{M}^p \times_f \tilde{M}^{n-p}$ is a non-flat warped product manifold with $(n-p) \geq 3$ satisfying the Roter type condition (4.3), then
(i) the fiber is of Roter type.
(ii) the fiber is of vanishing conformal curvature tensor if $M$ is conformally flat.
(iii) the fiber is of constant curvature if $-2(n-p)N_3\text{tr}(T) - N_2p - 2N_3\kappa \neq 0$.

Corollary 4.6. If $M^n = \tilde{M}^p \times_f \tilde{M}^{n-p}$ is a non-flat warped product manifold with $p \geq 3$ satisfying the Roter type condition (4.3), then the base is of Roter type if $T$, $\tilde{g}$ and $\tilde{S}$ are linearly dependent with non-zero coefficient of $T$.

Recently, Deszcz et al. [14] studied the warped product Roter type manifold with 1-dimensional fiber and showed the following:

Corollary 4.7. [14] If $M^n = \tilde{M}^{n-1} \times_f \tilde{M}^1$ is a non-flat warped product manifold satisfying the Roter type condition (4.3), then $\tilde{M}$ realizes a Roter type condition at those points, where it does not satisfy the Einstein metric condition.

Proof. Since the dimension of $\tilde{M}$ is $n - p = 1$, from the condition (iii) of Corollary 4.4, we get

$$(2fN_1 + N_2Q)\tilde{g} + (fN_2 + 2N_3Q)\tilde{S} + (f(1 + N_2) + 2N_3Q)T = 0.$$  

If at $x \in M$, $\tilde{S} \neq \frac{2}{n-2}\tilde{g}$, then $(f(1 + N_2) + 2N_3Q) \neq 0$ at $x$ and $T$ can be expressed as linear combination of $\tilde{S}$ and $\tilde{g}$ and hence by Corollary 4.6, $\tilde{M}$ satisfies a Roter type condition at $x$. This completes the proof. \qed

Now we can easily deduce the necessary and sufficient condition for a warped product manifold to be conformally flat manifold, as follows:

Corollary 4.8. If $M^n = \tilde{M}^p \times_f \tilde{M}^{n-p}$, $1 \leq p \leq n - 1$ is a non-flat warped product manifold, then $M$ is conformally flat if and only if
(i) $\tilde{R} = \frac{2f}{(n-1)(n-2)}\tilde{g} \wedge \tilde{g} + \frac{1}{n-2}\tilde{g} \wedge \tilde{S} - \frac{n-2}{n-2}\tilde{g} \wedge T$,
(ii) $\tilde{R} = \left[\frac{2f}{(n-1)(n-2)} + \frac{Q}{n-2} - \frac{1}{2}P\right]\tilde{g} \wedge \tilde{g} + \frac{1}{(n-2)}\tilde{g} \wedge \tilde{S}$,
(iii) $\left[\frac{2f}{(n-1)(n-2)} + \frac{Q}{n-2}\right]\tilde{g}_{ab}\tilde{g}_{\alpha\beta} + \frac{1}{n-2}\tilde{g}_{ab}\tilde{S}_{\alpha\beta} + \frac{f}{n-2}\tilde{S}_{ab}\tilde{g}_{\alpha\beta} + f \left(\frac{n-2}{n-2} + 1\right)T_{ab}\tilde{g}_{\alpha\beta} = 0$.

Proof. The result follows from Corollary 4.4 by taking $N_1 = \frac{3}{(n-1)(n-2)}$, $N_2 = \frac{1}{n-2}$ and $N_3 = 0$. \qed

From above we can state the following:

Corollary 4.9. [3] If $M^n = \tilde{M}^p \times_f \tilde{M}^{n-p}$ is a conformally flat warped product manifold, then
(i) for $(n-p) \geq 2$, the fiber is of constant curvature.
(ii) for $p \geq 2$, the base is of vanishing conformal curvature tensor.

Proof. By contracting the condition (iii) of Corollary 4.8, it follows that $T$ is a linear combination of $\tilde{g}$ and $\tilde{S}$, and $\tilde{S}$ is a scalar multiple of $\tilde{g}$. Putting these in the condition (i) and (ii) of Corollary 4.8, we get the results. \qed
Moreover: consider the warped product manifold \((\mathbb{M}, g) \times \mathbb{M}^{n-p})\). Then \((\mathbb{M}, g)\) is Einstein if and only if

\[
\left( \begin{array}{cccc}
\frac{\kappa}{n} & g_{11} & g_{12} & g_{13} \\
g_{21} & g_{22} & g_{23} & g_{24} \\
g_{31} & g_{32} & g_{33} & g_{34} \\
g_{41} & g_{42} & g_{43} & g_{44}
\end{array} \right) = 0.
\]

**Remark 4.1.** In this context we state the necessary and sufficient conditions of a warped product manifold to be Roter type by taking \(L_4 = L_5 = L_6 = 0\) and conformally flat by taking \(L_3 = L_4 = L_5 = L_6 = 0\). Again from the above results we see that the decompositions of a semi-Riemann product manifold are also semi-Riemann product manifold but the converse is not necessarily true, in general. We also note that the same situations arise for Roter type and conformally flat manifolds.

### 5 Examples

**Example 5.1:** Consider the warped product manifold \(M = \mathbb{M} \times_f \tilde{M}\), where \(\mathbb{M}\) is an open interval of \(\mathbb{R}\) with usual metric \(\bar{g} = (dx^1)^2\) in local coordinate \(x^1\) and \(\tilde{M}\) is a 4-dimensional manifold equipped with a semi-Riemannian metric

\[
\bar{g} = (dx^2)^2 + h(dx^3)^2 + h(dx^4)^2 + h\psi(dx^5)^2
\]

in local coordinates \((x^2, x^3, x^4, x^5)\), where the warping function \(f\) is a function of \(x^1\), and \(h\) and \(\psi\) are everywhere non-zero functions of \(x^2\) and \(x^5\) respectively. We can easily evaluate the local components of necessary tensors of \(\tilde{M}\). The non-zero components of the Riemann-Christoffel curvature tensor \(\bar{R}\) and the Ricci tensor \(\tilde{S}\) of \(\tilde{M}\) up to symmetry are

\[
\bar{R}_{1212} = \psi \bar{R}_{1313} = \bar{R}_{1414} = \psi \bar{R}_{2323} = \bar{R}_{3434} = -\frac{\psi}{T} (h')^2,
\]

\[
\bar{R}_{2424} = \frac{1}{4} \left( -\psi (h')^2 - 2h\psi'' + \frac{h'\psi'}{\psi} \right),
\]

\[
\tilde{S}_{11} = \frac{3(2h\psi'' + (h')^2)}{4\psi^2}, \quad \tilde{S}_{22} = \frac{1}{4} \left( 2h'' + (h')^2 - \frac{(\psi')^2 - 2\psi\psi''}{\psi^2} \right),
\]

\[
\tilde{S}_{33} = \frac{2hh'' + (h')^2}{4\psi^2}, \quad \tilde{S}_{44} = \frac{1}{4} \left( 2(\psi h'' + \psi') + \frac{h'\psi'}{\psi} - (\psi')^2 \right).
\]

We can easily check that this manifold is generalized Roter type and \(Ein(3)\) manifold. Moreover:
Step II: proper generalized Roter type warped product manifold with proper Roter type fiber.

The present paper is devoted to the study of warped product generalized Roter type manifolds and obtained the necessary and sufficient conditions for a warped product manifold with proper generalized Roter type and is constant curvature and in this case fiber is also of constant curvature.

Finally, consider $(2)$ manifold, hence Roter type; (ii) if $(\psi')^2 - 2\psi\psi'' = 0$, i.e., $\psi = \frac{(c_1x^3 + 2c_2)^2}{4c_2}$, then it is a manifold of constant curvature, where $c_1$ and $c_2$ are arbitrary constants.

By straightforward calculation, we can evaluate the components of various necessary tensors of $M$. The non-zero components of the Riemann-Christoffel curvature tensor $R$ and the Ricci tensor $S$ of $M$ up to symmetry are

$$h\psi R_{1212} = \psi R_{1313} = \psi R_{1414} = R_{1515} = h\psi \frac{(f')^2 - 2ff''}{4f'},$$
$$\psi R_{2323} = \psi R_{2424} = R_{2525} = \frac{1}{4} \left( -h(f')^2 - 2fh'' + \frac{f(h')^2}{h} \right),$$
$$\psi R_{3434} = R_{4545} = \frac{1}{4} \left( h^2 (f')^2 + f(h')^2 \right),$$
$$R_{3535} = \frac{1}{4} \left( f - \psi (h')^2 - 2h\psi'' + \frac{h\psi'(h')^2}{h} - h^2 \psi(f')^2 \right),$$
$$S_{11} = -\frac{(f')^2 - 2ff''}{f^2}, \quad S_{22} = \frac{1}{4} \left( 2f'' + \frac{2(f')^2}{f} + \frac{6h\psi'' - 3(h')^2}{h} \right),$$
$$\psi S_{33} = S_{55} = \frac{1}{4} \left( 2h\psi f'' + \frac{2h\psi(h')^2}{h} + 2h\psi'' + \frac{\psi(h')^2}{h} + 2\psi'' - \frac{(\psi')^2}{\psi} \right),$$
$$S_{44} = \frac{1}{4} \left( 2(hff'' + h^2\psi') + \frac{2hf(f')^2}{h} + \frac{(h')^2}{h} \right).$$

From these we can easily calculate the components of $S^2$, $S^3$, $S^4$ and also the components of $G$, $g \wedge S$, $S \wedge S$, $g \wedge S^2$, $S \wedge S^2$ and $S^2 \wedge S^2$. We observe that for every $f$, $h$ and $\psi$, the manifold is $Ein(4)$ but not of generalized Roter type. We now discuss the results for particular value of the functions $f$, $h$ and $\psi$ step by step as follows:

**Step I:** If $(h')^2 - hh'' = 0$, i.e., $h = c_1e^{x^2}$, then $M$ is generalized Roter type and $Ein(3)$. We note that in this case fiber $\tilde{M}$ is proper Roter type and hence $M$ is a proper generalized Roter type warped product manifold with proper Roter type fiber.

**Step II:** Again consider

$$-2(f')^2 + f(2f'' - 1) = 0,$$  

where $c_1$ and $c_2$ are arbitrary non-zero constants. Then the manifold is a $Ein(2)$ manifold and hence the manifold is proper Roter type. In this case fiber remains also Roter type. So $M$ is a warped product proper Roter type manifold with proper Roter type fiber.

**Step III:** Finally, consider $(\psi')^2 - 2\psi\psi'' = 0$, i.e., $\psi = \frac{(c_1x^3 + 2c_2)^2}{4c_2}$. Then $M$ is of constant curvature and in this case fiber is also of constant curvature.

If $f = (x^1)^2$, $h = c_2 \cos^2(x^2 - 2c_1)$ and $\psi = e^{x^3}$, then the manifold $M$ is a special generalized Roter type and is $Ein(3)$. In this case the fiber $\tilde{M}$ is proper generalized Roter type and is $Ein(3)$. Hence $M$ is a warped product generalized Roter type manifold with proper generalized Roter type fiber.

6 Conclusions

The present paper is devoted to the study of warped product generalized Roter type manifolds and obtained the necessary and sufficient conditions for a warped product
manifold to be of generalized Roter type manifold. As a particular case we obtain
the characterization of a warped product Roter type manifold. It is shown that the
fiber of a warped product $GRT_n$ (resp., $RT_n$, conformally flat) is also generalized
Roter type (resp., Roter type, manifold of constant curvature). We find out the
conditions for which the fiber of a warped product $GRT_n$ is Roter type, conformally
flat or a manifold of constant curvature and the base is a generalized Roter type.
It is also shown that the two decompositions of a $GRT_n$ product manifold are both
generalized Roter type but the product of two generalized Roter type manifolds is
not always generalized Roter type. Finally by suitable metric, the existence of such
case is ensured by an example.
